

Methodology for the measurement of nitrous oxide in livestock systems

COSTA RICA / HONDURAS / NICARAGUA / PANAMA

i Webstory

The technological solution

In livestock, the main sources of emissions correspond to enteric methane and nitrous oxide derived from nitrogen fertilization of pastures and forage crops. It is necessary to develop and validate protocols adapted to the livestock systems of the region to determine the amount of these gases emitted.

Description

The method uses the static camera technique. The chambers are cylindrical, made of PVC tube with a diameter of 24 cm in diameter and 38.0 cm in height, with an acrylic cover with a circular design with two holes, one that will contain a rubber septum to insert the thermometer and the other to sampling.

Results

- A model for estimating Greenhouse Gases (GHG) according to the 2006 IPCC.
- Quantified GHG emissions in the different livestock production systems of the region with different degrees of intensification.
- Communication, outreach and advocacy mechanisms have been developed to promote the use of competitive livestock systems with low GHG emissions.

ABOUT FONTAGRO

FONTAGRO is a unique cooperation mechanism for agricultural innovation in Latin America and the Caribbean (ALC) and Spain, that works through regional platforms. It is composed of 15 countries that have contributed capital exceeding 100 million dollars and the Inter-American Development Bank (IDB), which is its legal representative.

ORIGIN OF RESOURCES

- **Counterpart contribution**
93.177.555
- **FONTAGRO**
28.989.468
- **IDB**
9.922.700
- **Other agencies**
9.809.078

PARTICIPATION AND ROLE IN CONSORTIUMS SINCE 1998

FONTAGRO IN NUMBERS

193 Number of projects approved
